

CH 4 HUMAN REPRODUCTION TEST OUTLINE.

30 x choice questions

1 matching question

1 thought provoking question (only 1 ?!)

1 label diagram question (female or male rep. system diagram)

Here are some things you should study:

-Male and female secondary sex characteristics

-Gamete formation in males and females

-Male and female primary sex characteristics (you will need to know the parts. Some questions and for the diagrams)

-Hormones: know the names of the ones we covered and a basic idea of what they do

-Pregnancy: you will have the matching question about developmental changes for each developmental milestone. You will have to say if it happens during the 1st, 2nd, or 3rd trimester.

-Sex linked traits: What chromosome are they associated with? Which gender gets these afflictions more frequently? Why?.

-Menstrual cycle:. Know the different phases and the main things that happen in each stage.

-Did I mention vocab?

-Nondisjunction:. What is it? What are some of the effects of this? Be able to match the syndrome with its cause and effects.

-We have already have had a test about the male reproductive system, however there will still be some questions on this test too. Make sure you remember your parts and functions.

-Stem cells: what are they? What is it called when stem cells turn into another type of cell?
