

Ch 5 test outline.

1. Identify the following clues as being evidence of a physical or chemical change

Like it says. I give you a clue, you say "physical change" or "chemical change"

2. Density calculation. Show your work.

3. Label the following as being an element, compound, heterogeneous mixture or homogeneous mixture:

I have literally cut and pasted the questions here from the test. This time you need to identify the substance as being an element, compound, heterogeneous or homogeneous mixture.

4. Match the following physical and chemical properties with the correct description:

example: match "freezing point" with "the temperature at which a liquid becomes a solid".
Matching question. This is far too easy....

5. Write the correct term for each change in state of matter:

six words to memorize.

6. Last question is going to take some explaining using the KMT. I like this one, and my house is in it.

Bonus. Draw a picture of any animal wearing a wig on the back of your test and I will give you a bonus mark. This is only for people who use my website, so don't tell the non-believers. If I hear anyone talking about this before class, there will be no bonus mark, so don't ruin it for everyone
