BLM 3.1-11

3. If the baseball pitcher in question 2 throws the ball straight up, how high would it go before it slowed to a stop and started back down?

$E_T$   $\left( \begin{array}{l} \circ \\ E_k = 0 \\ V = 0 \\ E_p = mgh \end{array} \right)$

$E_T$   $\left( \begin{array}{l} E_p = 0 \\ E_k = \frac{1}{2}mv^2 \\ h = 0 \end{array} \right)$

Total energy here should = at the start. Since the kinetic eng is 0, the potential energy = Total Energy

$$E_g = mg \Delta h$$

$$\Delta h = \frac{E_g}{mg} = \frac{1.09 \times 10^2 \text{ kg m}^2 (\text{J})}{(0.1425 \text{ kg})(9.8 \frac{\text{m}}{\text{s}^2})} = 7.81 \times 10^1 \text{ m}$$

$\leftarrow$  Total energy (from #2, it is  $1.09 \times 10^2 \text{ J}$ )

4. a) A loaded box car has a total mass of  $6.80 \times 10^4 \text{ kg}$ . If the train is travelling at a speed of  $23.7 \text{ m/s}$ , what is the mechanical kinetic energy of the box car?

b) If a family car has a mass of  $1237 \text{ kg}$ , how fast would it have to go to have the same mechanical kinetic energy as the box car in part a)?

$b) v = \sqrt{\frac{2E_k}{m}}$

$$v = \sqrt{\frac{2(1.91 \times 10^7)}{1237}} = 3.09 \times 10^4 \frac{\text{kg m}^2}{\text{s}^2} \cdot \frac{1}{\text{kg}} = 3.09 \times 10^4 \frac{\text{m}}{\text{s}}$$

$a) E_k = \frac{1}{2}mv^2$

$$= \left(\frac{1}{2}\right)(6.80 \times 10^4 \text{ kg}) \left(\frac{23.7 \text{ m}}{\text{s}}\right) \left(\frac{23.7 \text{ m}}{\text{s}}\right) = 1.91 \times 10^7 \frac{\text{kg m}^2}{\text{s}^2} \rightarrow \text{J}$$
